The vaccines required on this form are for the purpose of implementing the requirements of Louisiana R.S. 17:170, and of meeting the established recommendations for control of vaccine-preventable diseases as recommended by the American Academy of Pediatrics (AAP); the Advisory Committee on Immunization Practices to the United States Public Health Service (ACIP); and the American College Health Association (ACHA). ## Meningitis Information:
Meningococcal disease is a serious disease that affects the brain and spinal cord. The disease is spread through droplet transmission from the nose or throat, such as sneezing or coughing, and direct contact with oral secretions of an infected individual. This includes such things as kissing, sharing drinks, food, utensils, cigarettes, lip balm or any object that has been in someone else’s mouth. Because meningitis is a grave illness and can rapidly progress to death, it requires early diagnosis and treatment. This is often difficult because the symptoms closely resemble those of the flu and the highest incidence of meningitis occurs during the late winter and early spring (flu-season). When not fatal, meningitis can lead to permanent disabilities such as hearing loss, brain damage, or loss of limbs.

The U.S. Centers for Disease Control and Prevention (CDC) and the American College Health Association (ACHA) recommend that college students, particularly freshmen living in dormitories, are at a greater risk for meningitis than the general population. Behavior and social aspects of college lifestyle activities put these students at greater risk. Two meningococcal vaccines are available in the U.S. – Menomune ® and Menactra TM (MCV4). The vaccinations are effective against 4 of the 5 most common bacterial types that cause 70% of the disease in the U.S. (but does not protect against all types of meningitis – DOES NOT COVER Group B serotype). Vaccinations take 7 – 10 days to become effective, with possible protection lasting 3 – 5 years. As with any vaccine, vaccination may not protect 100% of all susceptible individuals.

Who should not get the vaccine: people who have had Guillain-Barre Syndrome; Over 55 years old; Pregnant or suspect that you may be; Allergic to thimerosal, a substance found in several vaccines; Have an acute illness, with fever (101 or higher). Reactions to the vaccine may include pain, redness, and induration at the site of injection, headache, fatigue, and malaise. The vaccine is contraindicated in persons with known hypersensitivity to any component of the vaccine or to latex, which is used in the vial stopper. Because of the risk of injection site hemorrhage, the vaccine should not be given to persons with any bleeding disorder or to a person on anticoagulant therapy unless the potential benefit clearly outweighs the risk of administration. A few cases of Guillain-Barre Syndrome, a serious nervous system disorder, have been reported among people who received the vaccine. As with any vaccine, there is a possibility of an allergic reaction. Vaccination is available at Health Services (for a fee), private physician offices, and Health Units.
